

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

WRITE TESTS LIKE A MATHEMATICIAN

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

ISAAC J. LEE

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first recall the relations as follows

$$1 \rightarrow 2, 2 \rightarrow 3, 3 \rightarrow 4, 4 \rightarrow 5, 5 \rightarrow 6, 6 \rightarrow 1.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

Let α be an ordered set of vertices $\{\alpha_i\}_{i=1}^n$, $\beta \subseteq \mathbb{N}$ is called a *path* joining the vertices α and β if $\alpha \in \{\alpha_i\}_{i=1}^n$, $\beta \in \{\alpha_i\}_{i=1}^n$ and for every $k = 1, 2, \dots, n-1$ the set $\{\alpha_k, \alpha_{k+1}\} \cap \{\beta_{k+1}, \beta_{k+2}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a *tree* if each two members of V are joined by a unique simple path. Both tridiagonal and quadiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree G and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a *rooted tree*, while r is said to be the *root*. Unlike an ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $V \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is *monotonically ordered* if each vertex is labelled before all its predecessors (or, more precisely, we have the relation from the top of the tree to the root. If we have already said it, relabeling a graph is tantamount to relabeling the rows and the columns of the underlying matrix).

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three monotone orderings of the sample rooted tree:

Theorem III.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LUL^T$ is a Cholesky factorization, it is true that

$$a_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & * & * & 0 & * & * \\ 0 & * & 0 & * & * & * \\ * & 0 & * & 0 & * & * \\ 0 & * & 0 & * & 0 & * \\ * & * & 0 & 0 & * & * \\ 0 & * & * & * & 0 & * \end{bmatrix}$$

At a first glance, there is nothing to think in the case just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

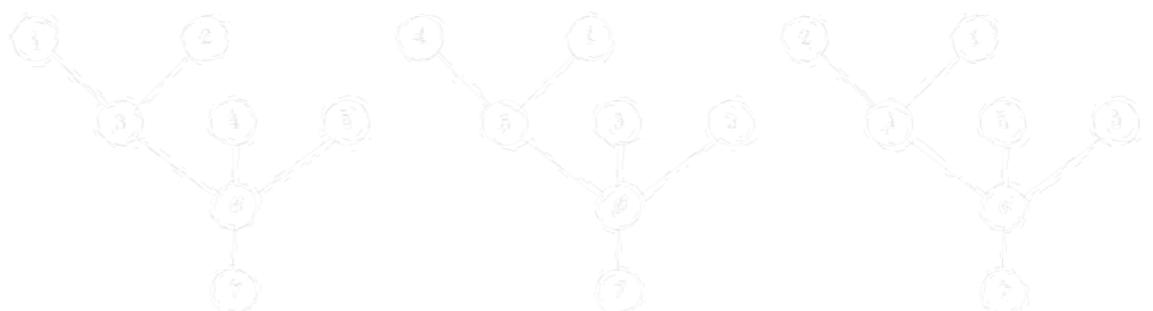

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and quidiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we label the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree.

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = L U$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{j,j}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\text{IF } \begin{bmatrix} * & * & 0 & 0 & 0 \\ 0 & * & * & 0 & 0 \\ * & 0 & * & * & 0 \\ 0 & * & 0 & * & * \\ 0 & 0 & * & * & * \end{bmatrix} \text{ THEN }$$

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than a cyclic matrix in disguise. To see this, just read the weights as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 1, 5 \rightarrow 6, 6 \rightarrow 3.$$

This, of course, is equivalent to reading off the weights of the edges and vertices. An acyclic graph $G = (V, E)$ is called a tree if the set $\{v_i, w_j\} \cap \{v_{i+1}, w_{j+1}\}$ contains exactly one member, it is a path if it does not visit any vertex more than once. We say that G is a tree if two members of V are joined by a unique simple path. Both tridiagonal and acyclic matrices correspond to trees, the case with either quadrilateral or cyclic matrices when $p \geq 3$.

Given a tree, while ordering a vertex r is the root of r . Note each vertex of r . We say that a is a predecessor of r if a is joined to r by a simple path and we designate by $\pi(a, r)$ the path, except for r and a , as a predecessor of a and a successor of r . Every vertex is labelled with a number, and the rooted tree is monotonically ordered, if each vertex is labelled with a number, in other words, we label the vertices from the top of the tree. (As we have already said in relabelling a graph is tantamount to rows and columns of the underlying matrix.)

Every node in a tree is not simple, and, in general, the ordering is not unique.

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $\mathbf{T} = (G, r)$ is monotonically ordered. Given that $A = \mathbf{L}\mathbf{U}$ is a Cholesky factorization, it is true that

$$t_{k,j} = \frac{a_{kj}}{t_{j,j}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}.$$

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \mathbb{N}_0}$ in \mathbb{G} is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_{k-1}, j_k\} \cap \{i_k, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members i_0, j_0 are joined by a unique simple path. Both tridiagonal and quindiagonal matrices correspond to trees; this is not the case with either quidiagonal or cyclic matrices.

Let \mathbb{G} be a tree and an arbitrary vertex $r \in V$. The pair $T = (\mathbb{G}, r)$ is called a rooted tree, where r is said to be the root. Unlike in a cyclic graph, there is no unique path from a vertex to the root. This can best be explained by an example. Let \mathbb{G} be a tree with r as the root, which is the predecessor of all the vertices in $V \setminus \{r\}$. Then r is the root of \mathbb{G} . Moreover, every $v \in V \setminus \{r\}$ is joined to r by a unique path, which consists of vertices along this path. We say that the rooted tree T is monotonically ordered if every vertex $v \in V \setminus \{r\}$ has a predecessor in \mathbb{G} (in other words, v is layered above its predecessor). We call this root. (As we have already said, it is not unique.) Relabelling a graph in this way is called a topological ordering. Every rooted tree will be monotonically ordered and, in general, it is not unique. We will give three consecutive examples of the construction of such trees.

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $\mathbb{T} = (\mathbb{G}, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{j,j}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their analysis.

1

```
assert.speaker().getsPersonal();  
  
await sing('Happy Birthday');  
  
assert.audience().isHappy();
```

just displayed, but its graph:

$$t_{k,j} = \frac{q_{kj}}{q_j}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

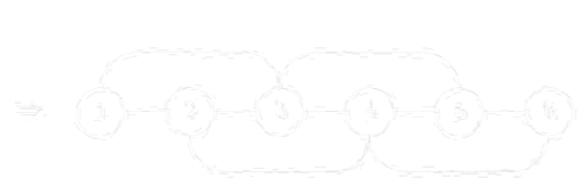

Therefore we will now give a few examples of matrices (represented by their sparsity)

and their graphs.

SUSPECT 1

quindiagonal:

OBSERVER /

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

COMPUTED

At a first glance, the matrix A and its structure of the form of a symmetric matrix just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, j)\}_{i,j=1}^n$ in \mathbb{G} is called a path joining the vertices v_i and v_j if $i \in \{1, \dots, n\}$, $j \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{v_i, j\} \cap \{v_{i+k}, v_{i+k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members of \mathbb{V} are joined by a unique simple path. Both tri-diagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree \mathbb{T} and an arbitrary vertex $r \in \mathbb{V}$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $v \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and v , as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree.

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their up to date

SUSPECT 2

EMBER DATA

FORM BUILDER

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A were been arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

and their graphs.

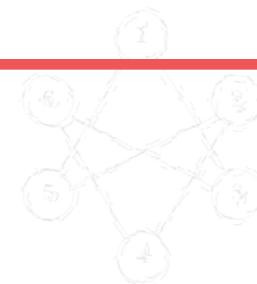

SUSPECT 4

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

LEAKAGE

At a first glance, this is nothing but a collection of the four matrices above, but it is just displayed, but its graph:

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

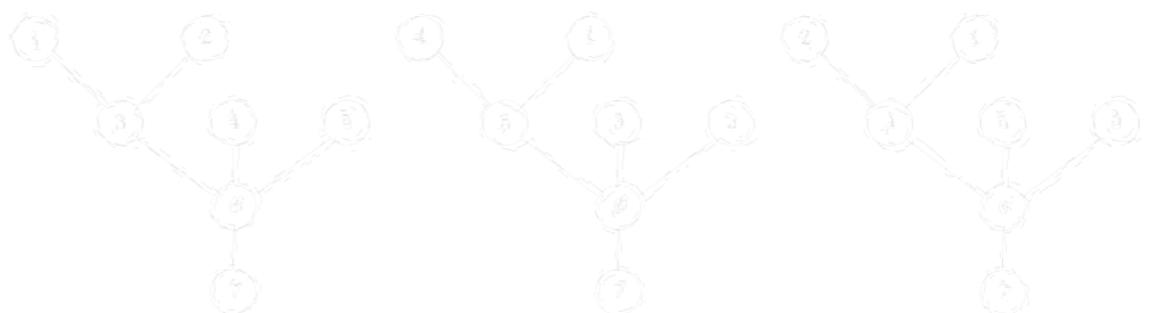

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ $\subseteq \mathbb{E}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tri-diagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T adapts a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive drawings of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A were been arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

and their graphs.

SUSPECT 5

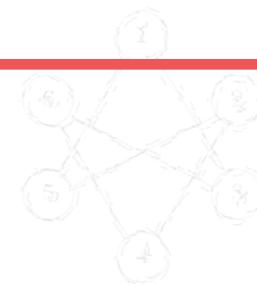

ADMIN

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

PRIVILEGE

At a first glance, this is nothing but a list of the four columns of the matrix

just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

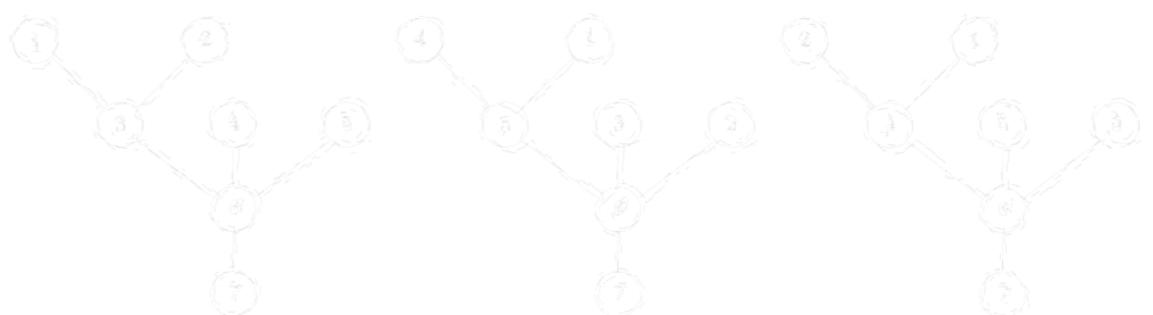

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \mathbb{N}_0, i_0 \neq j_0}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a predecessor of a and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

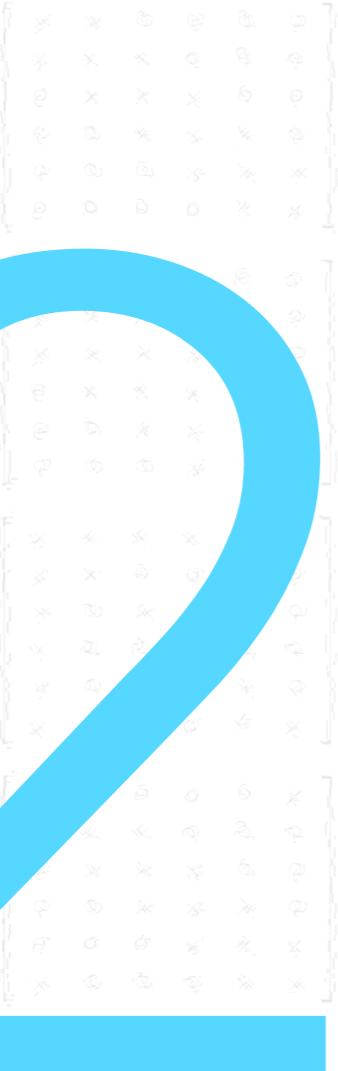

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree.

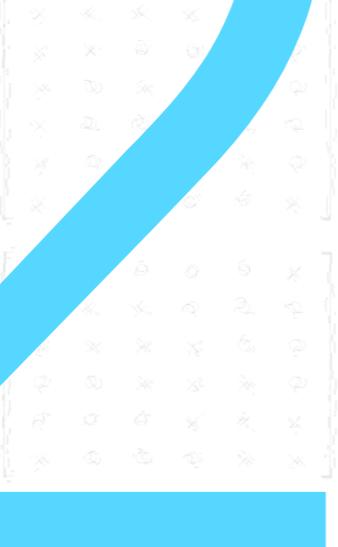

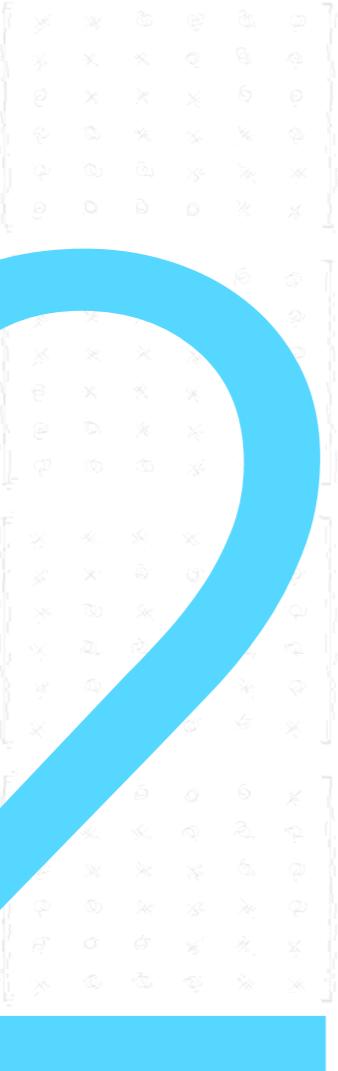

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A were been arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tridiagonal:

symmetric:

cyclic:

2

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

At a first glance, there is nothing to link it to any of the three structures just displayed, but its graph,

USE COMMON EVERYDAY WORDS

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 1.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{v_1, v_2, \dots, v_p\} \subseteq E$ is called a path joining the vertices v_1 and v_p ($v_1, v_p \in V$). If $v_1 = v_p$ and for every $i = 1, \dots, p-1$ the set $\{v_i, v_{i+1}\} \cap E$ contains exactly one member, it is a simple path if it does not visit any vertex more than once. We say that G is tree if each two members of V are joined by a unique simple path. (In this case, all other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $p \geq 3$.)

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we label the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is unique. To give the precise definition of the unique rooted tree,

Theorem 1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = L U$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{k,j}}{l_{j,j}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

and their graphs

triangular: $\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix} \Rightarrow \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{array} \xrightarrow{1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 5, 4 \rightarrow 6, 5 \rightarrow 6, 6 \rightarrow 6}$

quidiagonal: $\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ * & * & * & * & * & 0 \\ 0 & * & * & * & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 0 & 0 & * & * & * \end{bmatrix} \Rightarrow \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{array} \xrightarrow{1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 4, 4 \rightarrow 5, 5 \rightarrow 6, 6 \rightarrow 6}$

superdiagonal: $\begin{bmatrix} * & * & * & * & * & * \\ * & 0 & 0 & 0 & 0 & 0 \\ * & 2 & 0 & 0 & 0 & 0 \\ * & 2 & 2 & 0 & 0 & 0 \\ * & 2 & 2 & 2 & 0 & 0 \\ * & 2 & 2 & 2 & 2 & 0 \end{bmatrix} \Rightarrow \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{array} \xrightarrow{1 \rightarrow 1, 2 \rightarrow 2, 3 \rightarrow 3, 4 \rightarrow 4, 5 \rightarrow 5, 6 \rightarrow 6}$

cyclic: $\begin{bmatrix} * & 0 & 0 & 0 & * & * \\ * & * & 0 & 0 & 2 & 2 \\ * & * & * & 0 & 2 & 2 \\ * & * & * & * & * & 2 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \Rightarrow \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \end{array} \xrightarrow{1 \rightarrow 1, 2 \rightarrow 2, 3 \rightarrow 3, 4 \rightarrow 4, 5 \rightarrow 5, 6 \rightarrow 6}$

CONVENTION;

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

AGREED ON BY MANY

At a first glance, this is not a triangular matrix, but it is a tree structure, as the one just displayed, but its graph:

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 4, 5 \rightarrow 6, 6 \rightarrow 3.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ $\subseteq \mathbb{E}$ is called a path joining the vertices i_0 and j_0 if $i_0, j_0 \in \{1, \dots, n\}$, $i_0 \neq j_0$, $\{i_0, j_0\} \in \mathbb{E}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T adapts a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

tridiagonal:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & 0 & * & * & 0 & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * & * \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

EVERYDAY

quindiagonal:

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ * & * & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

superdiagonal:

$$\begin{bmatrix} * & * & * & * & * & * \\ * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & * & * & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

cyclic:

$$\begin{bmatrix} * & 0 & 0 & 0 & * & * \\ * & * & 0 & 2 & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 2 & * & * & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

SIMPLE;

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

FAMILIAR TO MANY

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & * & * & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & * & * & * & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & * & * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & * & * & * & * & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & * & * & * & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & * & * & * & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * & * & * & * & * \\ 0 & 0 & 0 & 0 & 0 & * & * & * & * & * \end{bmatrix}$$

At a first glance this is not a matrix that looks like the ones we have been discussing just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

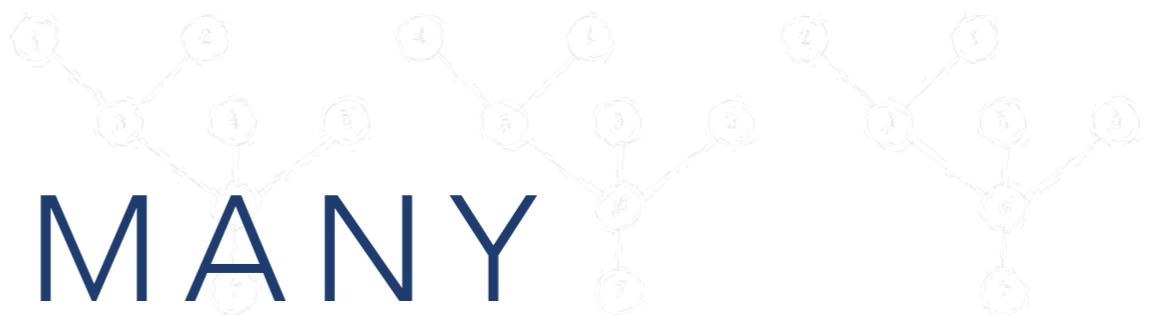

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{1, \dots, n\}$, $j_0 \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and quidiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

triangular:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

quadrangular:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

cyclic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

IF f IS CONTINUOUS IN $[a, b]$, AND IF $f(a)f(b) < 0$,

THEN $f(x)$ MUST HAVE A

ZERO IN (a, b) .

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

At a first glance, this is not a triangular matrix, but it is a triangular matrix, just displayed, but its graph,

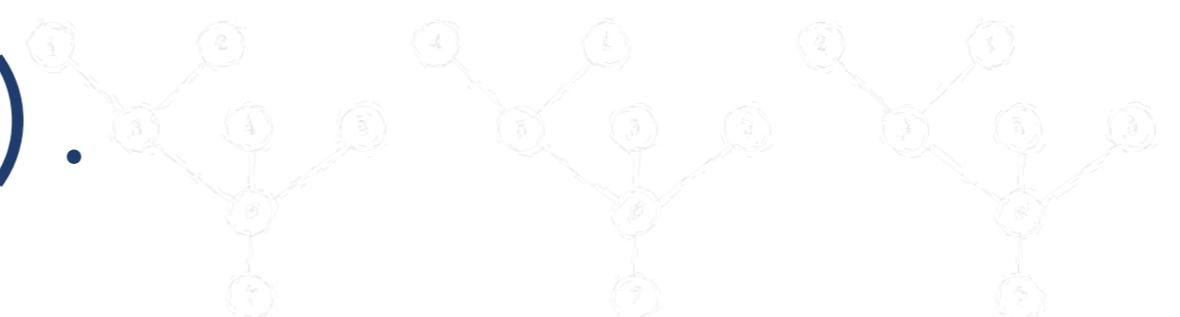

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 2, 3 \rightarrow 3, 4 \rightarrow 4, 5 \rightarrow 5, 6 \rightarrow 6.$$

Of course, it is equivalent to relabeling the equations and variables. As a result, we get the following: G is called a *tree* if visiting the vertices a and b ($a \in V, b \in V, a \neq b$), $\beta \in V \setminus \{a, b\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{V_k, \beta\} \cap V_{k+1, k+1}$ contains exactly one member. It is a *simple path* if it does not visit any vertex more than once. We say that G is a *tree* if each two members of V are joined by a unique simple path. Both triangular and any other matrices correspond to trees, but this is not the case with either of tridiagonal or cyclic matrices when $n \geq 3$.

As a result, the *rooted tree* $T = (G, r)$ is called a *rooted tree*, which is a tree with a root vertex r . Unlike in a binary tree, there is a natural partial order, which can be explained in analogy with a family tree. Thus, the root r is the *ancestor* of all the vertices in $V \setminus \{r\}$ and these vertices are *successors* of r . Moreover, every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a *predecessor* of a and a *successor* of r . We say that the rooted tree T is *monotonically ordered* if each vertex is labelled with an integer $r \leq i \leq n$ in such a way that the label of the vertex is *monotonically increasing* along the rows and the columns of the underlying matrix.

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

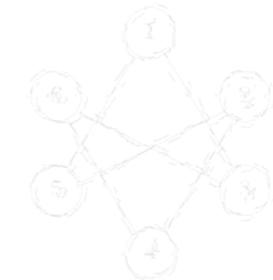

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are now arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

```

cyclic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

IF f IS CONTINUOUS IN $[a, b]$, AND IF $f(a)f(b) < 0$,

THEN f MUST HAVE A

ZERO IN (a, b) .

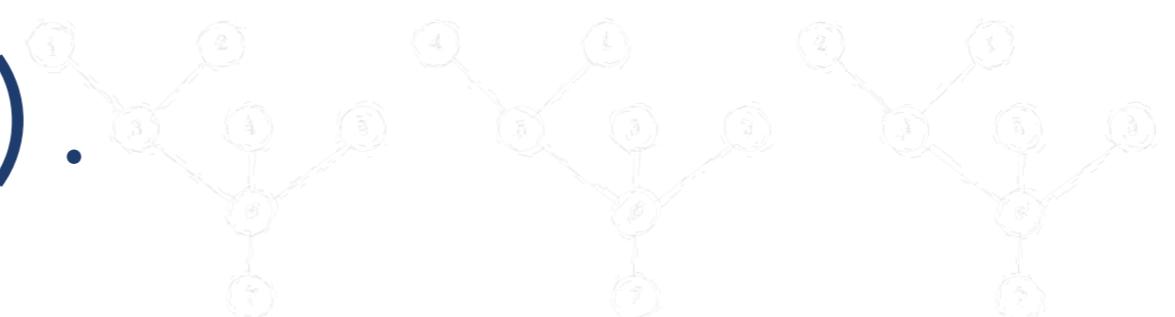

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 2, 3 \rightarrow 3, 4 \rightarrow 4, 5 \rightarrow 5, 6 \rightarrow 3.$$

Of course, it is equivalent to replacing (arbitrarily) the equations and variables. As you can see from the figure, the graph G is called a tree, since the vertices a and b ($a \in V \setminus \{b\}$, $b \in V \setminus \{a\}$) and for every $k = 1, 2, \dots, n-1$ the set $\{v_1, v_2, \dots, v_k\} \cap \{v_{k+1}, v_{k+2}, \dots, v_{n-1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either of banded or cyclic matrices when $n \geq 3$.

Of course, a rooted tree is a tree with a root vertex r . Unlike in a binary tree, there is a natural partial order which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $V \setminus \{r\}$ and these vertices are successors of r . Moreover, every $v \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and v , as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled by an integer $r \in \{1, 2, \dots, n\}$ in such a way that the vertices from the top of the tree to the bottom are in increasing order (in other words, if we read the vertices from the top of the tree to the bottom, we have a strictly increasing sequence). Labeling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

At a first glance, this is not a very useful formula, but it is the basis for the following algorithm.

just displayed, but its graph:

Therefore we will now give a few examples of matrices (represented by their sparsity)

PROOF.

USE THE INTERMEDIATE
VALUE THEOREM.

cyclic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 \\ 0 & * & * & 0 & 0 \\ * & 0 & * & 0 & 0 \\ 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & * \end{bmatrix}$$

$$\begin{bmatrix} * & * & 0 & 0 & 0 \\ 0 & * & * & 0 & 0 \\ * & 0 & * & 0 & 0 \\ 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & * \end{bmatrix}$$

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ * & 0 & * & * & 0 & 0 \\ 0 & 0 & 0 & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & x & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & 0 & * & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & 0 & * & 0 \end{bmatrix}$$

At a first glance this is not a cyclic matrix, but it is. Its graph is the one just displayed, but its graph:

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \mathbb{N}_0, i_0 \neq j_0}$ in \mathbb{G} is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertices more than once. We say that \mathbb{G} is a tree if in two members of \mathbb{V} are joined by a unique simple path. Known tridiagonal and cyclic matrices correspond to trees, but this is not the case with either quadiagonal or cyclic matrices when $n \geq 4$.

Given a tree \mathbb{T} and an arbitrary vertex $r \in \mathbb{V}$, the pair $\mathbb{T} = (\mathbb{G}, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, \mathbb{T} admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root is the ancestor of all the vertices in $\mathbb{T} \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate any vertex along this path, except for r and a , as a predecessor of a and a successor of r . We say that the rooted tree \mathbb{T} is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $\mathbb{T} = (\mathbb{G}, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{k,j}}{l_{j,j}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

tridiagonal: $\begin{bmatrix} * & * & 0 & 0 & 0 \\ * & * & * & 0 & 0 \\ 0 & 0 & * & * & 0 \\ 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * \end{bmatrix}$

PROOF.

quidiagonal: $\begin{bmatrix} * & * & 0 & 0 & 0 \\ * & * & * & 0 & 0 \\ 0 & 0 & * & * & 0 \\ 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * \end{bmatrix}$

use IVT.

quintidiagonal: $\begin{bmatrix} * & * & * & * & * & 0 & 0 \\ * & * & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$

cyclic: $\begin{bmatrix} * & 0 & 0 & 0 & * & 0 \\ * & * & 0 & 2 & * & 0 \\ 0 & * & * & 3 & 0 & 0 \\ 0 & 2 & * & * & 4 & 0 \\ 0 & 0 & 3 & * & * & 5 \\ 0 & 0 & 0 & 4 & * & * \end{bmatrix}$

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}$$

At a first glance this is not a tridiagonal matrix, but it is. Its graph is the one just displayed, but its graph:

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0, j_0 \in \{1, \dots, n\}$, $i_0 \neq j_0$, $i_0 \in \{1, \dots, n\}$, and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and quidiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T adapts a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

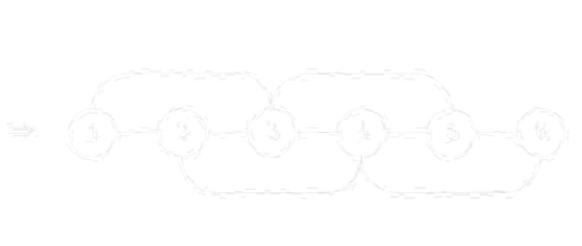

Therefore we will now give a few examples of matrices (represented by their sparsity)

PROVEN

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

TO BE TRUE

At a first glance, this is a random matrix, but it has a triangular structure, just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{1, \dots, n\}$, $j_0 \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tri-diagonal and super-diagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

```
import { fillIn } from '@ember/test-helpers';

export async function fillForm(fields) {
  for (const { label, value } of fields) {
    // input, textarea
    await fillIn(`[data-test-field="${label}"`, value);
  }
};
```

```
import { fillForm } from '../helpers/my-test-helper';

...
test('User can create account', async function(assert) {
  await visit('/signup');
  await fillForm([
    { label: 'Name', value: 'Little Bobby Tables' },
    { label: 'Email', value: 'little.bobby@gmail.com' }
  ]);
  ...
});
```

Therefore we will now give a few examples of matrices (represented by their sparsity)

tri-diagonal:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & 0 & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \Rightarrow \text{graph: } \begin{array}{c} 1 \\ \text{---} \\ 2 \text{---} 3 \text{---} 4 \text{---} 5 \text{---} 6 \end{array}$$

quindiagonal:

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ * & * & * & * & * & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \Rightarrow \text{graph: } \begin{array}{c} 1 \\ \text{---} \\ 2 \text{---} 3 \text{---} 4 \text{---} 5 \text{---} 6 \end{array}$$

super-diagonal:

$$\begin{bmatrix} * & * & * & * & * & * \\ * & 0 & 0 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 & 0 \end{bmatrix} \Rightarrow \text{graph: } \begin{array}{c} 1 \\ \text{---} \\ 2 \text{---} 3 \text{---} 4 \text{---} 5 \text{---} 6 \end{array}$$

cyclic:

$$\begin{bmatrix} * & 0 & 0 & 0 & * & * \\ * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & * & 0 & 0 & 0 \\ 0 & 0 & 0 & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix} \Rightarrow \text{graph: } \begin{array}{c} 1 \text{---} 2 \text{---} 3 \text{---} 4 \text{---} 5 \text{---} 6 \text{---} 1 \end{array}$$

UBIQUITOUS

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

IDEA

At a first glance this is not a matrix, but a graph. But it is a matrix, as we have just displayed, but its graph:

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, j_i)\}_{i=1}^n$ in \mathbb{G} is called a path joining the vertices v_i and v_j if $i \in \{1, \dots, n\}$, $j \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{v_i, j_i\} \cap \{v_{i+1}, j_{i+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members of \mathbb{V} are joined by a unique simple path. Both tri-diagonal and super-diagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree \mathbb{T} and an arbitrary vertex $r \in \mathbb{V}$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T adapts a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $\mathbb{V} \setminus \{r\}$ and these vertices are successors of r . Moreover, every $v \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and v , as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

triangular:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

quadrangular:

supernodal:

cyclic:

IF f IS CONTINUOUS IN $[a, b]$, AND IF $f(a)f(b) < 0$,

THEN f MUST HAVE A

ZERO IN (a, b) .

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 3 \rightarrow 5, \quad 2 \rightarrow 4 \rightarrow 6, \quad 3 \rightarrow 1, \quad 4 \rightarrow 2.$$

Of course, it is equivalent to relabeling (or transposing) the equations and variables. As a result, the set of edges $\{e_{i,j}\}$ of \mathbb{G} is called a *spanning* the vertices a and b ($a \in \{1, 2, \dots, n\}$, $b \in \{1, 2, \dots, n\}$) and for every $k = 1, 2, \dots, n-1$ the set $\{e_{i,j}\} \cap \{e_{i+k, j+k}\}$ contains exactly one member. It is a *simple path* if it does not visit any vertex more than once. We say that \mathbb{G} is a *tree* if each two members of \mathbb{V} are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either of bidiagonal or cyclic matrices when $n \geq 3$.

As a result, a rooted tree $T = (G, r)$ is called a *rooted tree* (which is not to be confused with a *rooted binary tree* in the more usual sense). To date, a natural partial ordering which can best be explained by an analogy with a family tree. Thus, the root r is the *ancestor* of all the vertices in $\mathbb{V} \setminus \{r\}$ and these vertices are *successors* of r . Moreover, every $a \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a *predecessor* of a and a *successor* of r . We say that the rooted tree T is *monotonically ordered* if each vertex is labelled $r < a_1 < a_2 < \dots < a_n$ (in other words, we say the vertices from the top of the tree to the bottom, as we have already said). Labelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Therefore we will now give a few examples of matrices (represented by their sparsity)

triangular:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

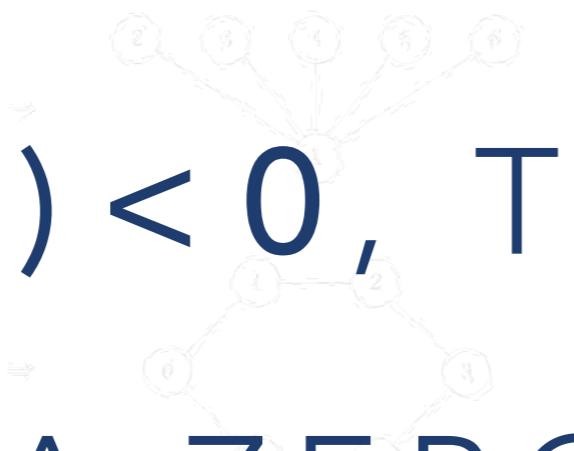

quadratic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

symmetric:

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ * & * & * & * & * & 0 \\ 0 & * & * & * & * & * \\ 0 & 0 & * & * & * & * \\ 0 & 0 & 0 & * & * & * \end{bmatrix}$$

cyclic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & * & * & 0 & * & 0 \\ 0 & * & 0 & * & * & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & * & 0 \\ * & * & 0 & 0 & * & * \\ 0 & * & * & 0 & * & * \end{bmatrix}$$

At a first glance, this is not a triangular, quadratic, or cyclic matrix. But it is a matrix that has just been displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 4, 6 \rightarrow 6.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_1, j_1)\}_{i_1, j_1 \in \mathbb{N}_0}$ $\subseteq \mathbb{E}$ is called a path joining the vertices i_1 and j_1 if $i_1, j_1 \in \{1, \dots, n\}$, $i_1 \neq j_1$, $i_1, j_1 \in \mathbb{N}_0$ and for every $p = 1, 2, \dots, \nu - 1$ the set $\{i_p, j_p\} \cap \{i_{p+1}, j_{p+1}\}$ contains only one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both quadiagonal and symmetric matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree G and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a digraph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the predecessor of the vertex v is the vertex u if v is a successor of u in the tree T . Moreover, every $u \in G$ is the predecessor of v in the path and we designate u as a parent along this path, except for v , which is a predecessor of v and a successor of u . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we lay out the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We will give three examples consisting of the same rooted tree:

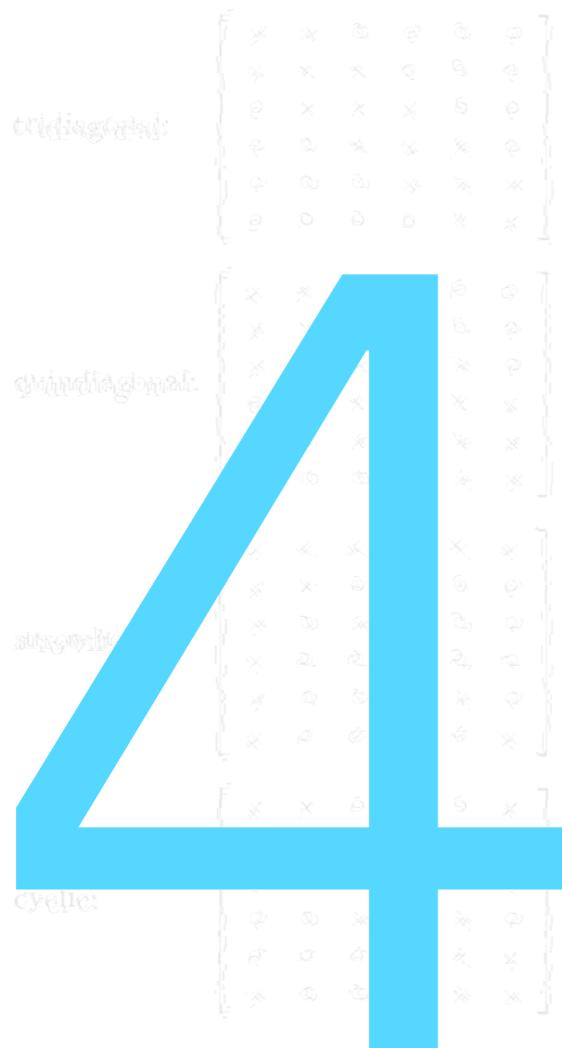

Theorem 11.1 Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

```
hooks.beforeEach(function(assert) {  
  ...  
  // Example: assert.isEnabled('Submit', 'Woot!');  
  assert.isEnabled = (label, message) => {  
    assert.dom(`[data-test-button="${label}"`)  
      .hasNoAttribute('disabled', message);  
  };  
  ...  
});
```

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}$$

At a first glance, there is nothing to link it to any of the four structures just displayed, but its graph,

ALL YOUR BASIS ARE BELONG TO US

Therefore we will now give a few examples of matrices (represented by their sparsity)

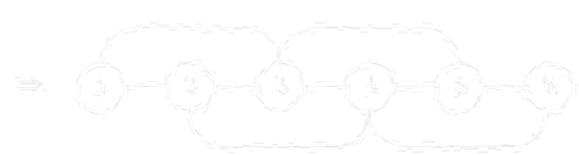

triangular:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix}$$

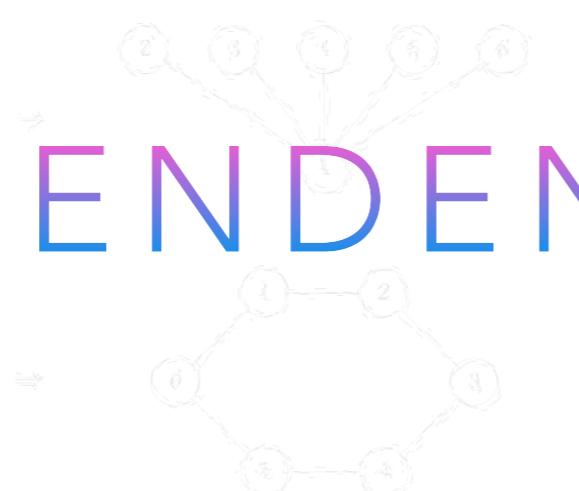

quidiagonal:

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ * & * & * & * & * & 0 \\ 0 & * & * & * & * & * \\ 0 & * & * & * & * & * \\ 0 & 0 & * & * & * & * \end{bmatrix}$$

symmetric:

$$\begin{bmatrix} * & * & * & * & * & * \\ * & * & 0 & 0 & 0 & 0 \\ * & 0 & * & 0 & 0 & 0 \\ * & 0 & 0 & * & 0 & 0 \\ * & 0 & 0 & 0 & * & 0 \\ * & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

THAT

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

SPAN THE ENTIRE SPACE

At a first glance, the matrix in the following looks like a random matrix, but it is not just displayed, but its graph:

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, j)\}_{i=1}^n$ in \mathbb{G} is called a path joining the vertices v_i and v_j if $i \in \{1, \dots, n\}$, $j \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{v_i, j\} \cap \{v_{i+k}, v_{i+k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree \mathbb{G} and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the only vertex that has no predecessors and all other vertices are successors of r . Moreover, every $v \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex alone, throughout, except for r and v , as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A were then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph.

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 4, 5 \rightarrow 6, 6 \rightarrow 3.$$

Of course, it is equivalent to renumbering (cyclic shift) the vertices and to consider a different set of edges $\{ (i, j) \mid i, j \in \{1, 2, \dots, 6\} \}$. It is called a *cycle* if the vertices $i, j \in \{1, 2, \dots, n\}$ and for every $\ell = 1, 2, \dots, n-1$ the set $\{i + \ell, j + \ell\}$ contains exactly one member. It is a *simple path* if it does not visit any vertex more than once. We say that G is a *tree* if each two members of V are joined by a unique path. Both tridiagonal and antidiagonal matrices correspond to the case with either quidiagonal or cyclic matrices when $\ell = 1, 2, \dots, n-1$ and no arbitrary vertex $v \in V \setminus \{r\}$ is called a *rooted tree* and r is called the *root*. Unlike in a ordinary graph, T admits a natural partial order that must be explained by an analogy with a family tree. Thus, the ancestor of all the vertices in $T \setminus \{r\}$ and these vertices are *successors*. Every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate this path, except for r and a , as a *predecessor* of a and a *successor*. The rooted tree T is *monotonically ordered* if each vertex is labelled with a natural number in other words, we label the vertices from the top of the tree to the bottom (we have already done it, relabeling a graph to a tree). (This is another reason to call T a *tree* and not a *forest* in general, such a labeling does not give three separate components of the same source tree.)

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Then, that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tridiagonal:

$$\begin{bmatrix} * & * & 0 & & \\ * & * & * & 0 & \\ 0 & & & & \end{bmatrix}$$

quadratic:

$$\begin{bmatrix} * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \\ * & * & * & * & * & * & * & * & * \end{bmatrix}$$

triangular:

$$\begin{bmatrix} * & & & & \\ * & * & & & \\ * & * & * & & \\ * & * & * & * & \\ * & * & * & * & * \end{bmatrix}$$

pentagonal:

$$\begin{bmatrix} * & & & & & & \\ & * & & & & & \\ & & * & & & & \\ & & & * & & & \\ & & & & * & & \\ & & & & & * & \\ & & & & & & * \end{bmatrix}$$

hexagonal:

$$\begin{bmatrix} * & & & & & & & & \\ & * & & & & & & & \\ & & * & & & & & & \\ & & & * & & & & & \\ & & & & * & & & & \\ & & & & & * & & & \\ & & & & & & * & & \\ & & & & & & & * & \\ & & & & & & & & * \end{bmatrix}$$

icosahedral:

$$\begin{bmatrix} * & & & & & & & & & & & & \\ & * & & & & & & & & & & & \\ & & * & & & & & & & & & & \\ & & & * & & & & & & & & & \\ & & & & * & & & & & & & & \\ & & & & & * & & & & & & & \\ & & & & & & * & & & & & & \\ & & & & & & & * & & & & & \\ & & & & & & & & * & & & & \\ & & & & & & & & & * & & & \\ & & & & & & & & & & * & & \\ & & & & & & & & & & & * & \\ & & & & & & & & & & & & * \end{bmatrix}$$

icosahedron:

$$\begin{bmatrix} * & & & & & & & & & & & & \\ & * & & & & & & & & & & & \\ & & * & & & & & & & & & & \\ & & & * & & & & & & & & & \\ & & & & * & & & & & & & & \\ & & & & & * & & & & & & & \\ & & & & & & * & & & & & & \\ & & & & & & & * & & & & & \\ & & & & & & & & * & & & & \\ & & & & & & & & & * & & & \\ & & & & & & & & & & * & & \\ & & & & & & & & & & & * & \\ & & & & & & & & & & & & * \end{bmatrix}$$

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 4, 5 \rightarrow 6, 6 \rightarrow 8.$$

Of course, it is equivalent to renumbering (cyclic shift) the vertices and the edges. Consider a set of edges $\{ (i, j) \mid i, j \in \{1, 2, \dots, n\} \}$ and for every $i = 1, 2, \dots, n-1$ the set $\{ (i, i+1) \}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a simple path. Both tridiagonal and cyclic matrices correspond to trees. There are two types of trees with either quidiagonal or cyclic matrices: $P(3)$ and $P(4)$. The first is a star and an arbitrary vertex $r \in V$ is the root. The second is a rooted tree and to be the root. Unlike in a ordinary graph, T admits a natural partial order that must be explained by an analogy with a family tree. Thus, the ancestor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate this path, except for r and a , as a predecessor of a and a successor of r . The rooted tree T is monotonically ordered if each vertex is labelled with its rank in other words, we layed the vertices from the top of the tree to the bottom. (This is not always possible, in general, such a labeling does not give three consecutive vertices of the same parent tree.)

LATITUDE

30.267°

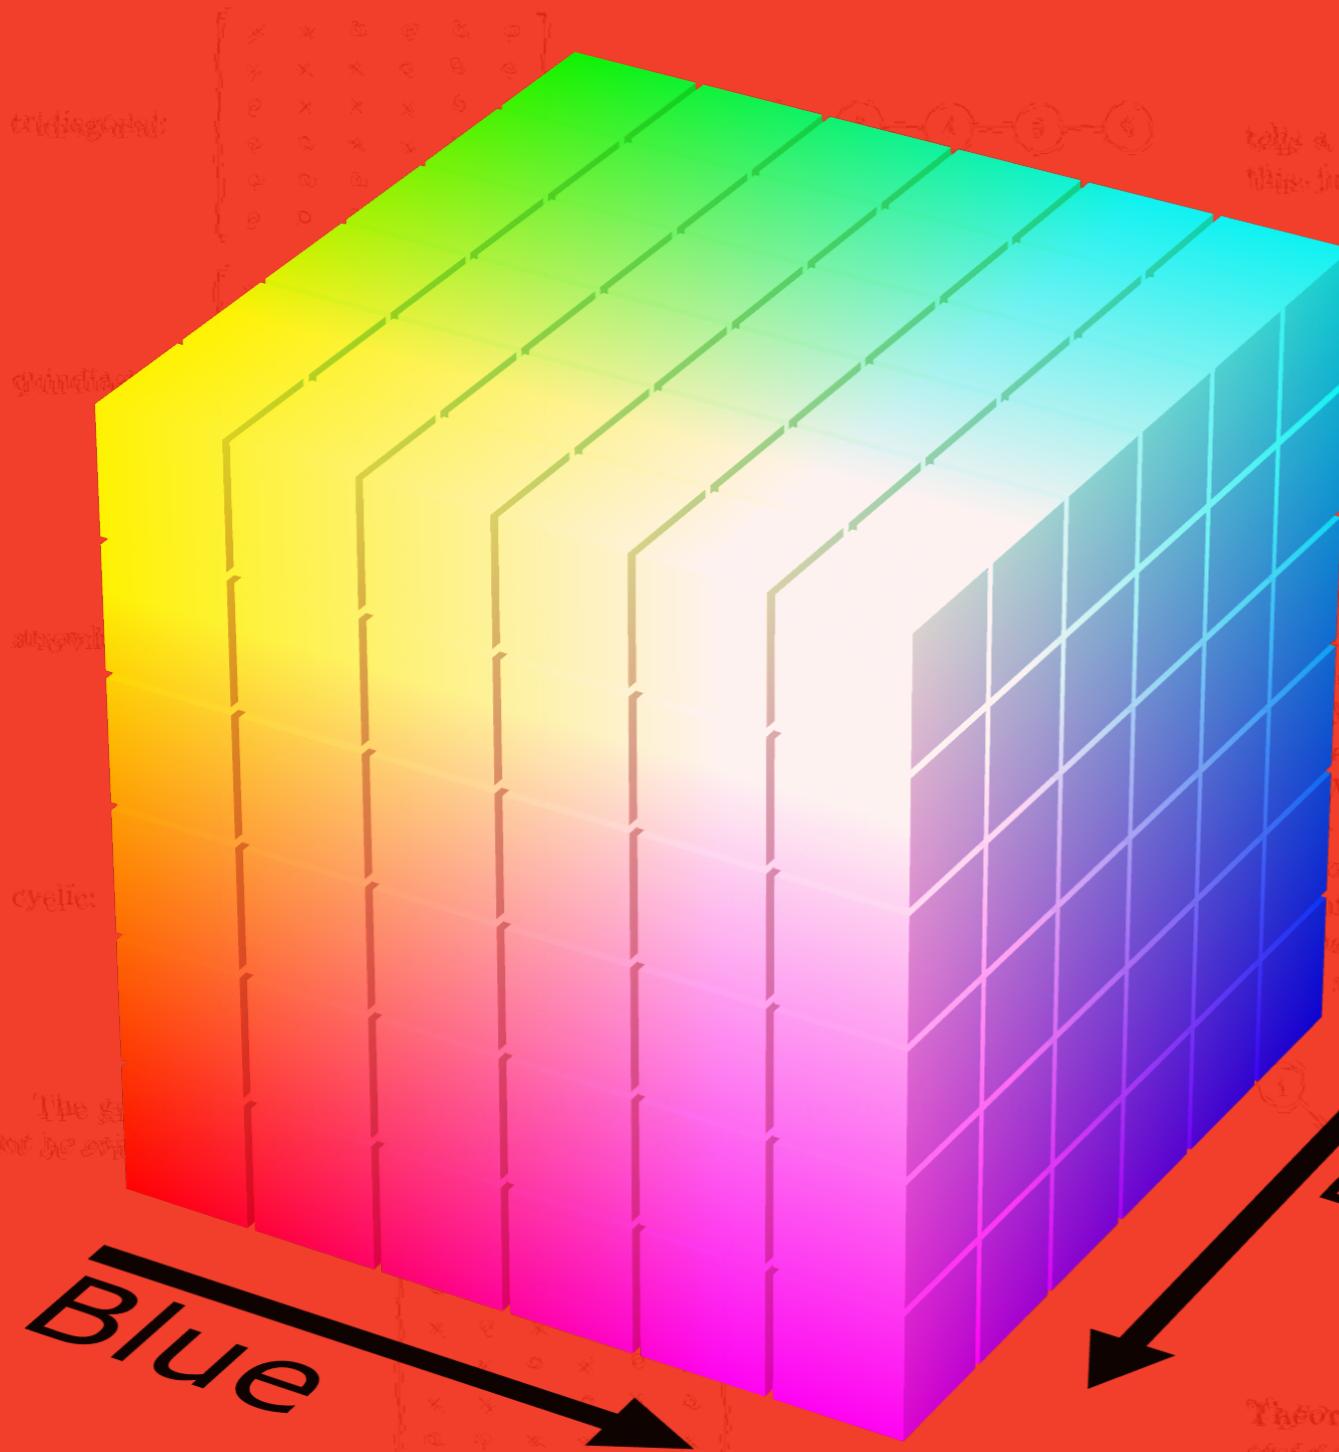

LONGITUDE

-97.743°

Theorem 11.1 Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are now arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{j,j}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

At a first glance, there is nothing to link in to any of the four matrices that we have just displayed, but its graph.

RED

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 4, 5 \rightarrow 6, 6 \rightarrow 5$$

Of course, it is equivalent to reordering (simultaneously) the columns and rows. A *partial set of steps* $\{(v_i, j_i)\}_{i=1}^n \subseteq \mathbb{E}$ is called a *path* joining the vertices v_i and v_j if $(v_i, j_i), j_i \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{v_{k+1}, j_{k+1}\} \cap \{v_i, j_i\}$ contains exactly one member. It is a *simple path* if it does not visit any vertex more than once. We say that G is a *tree* if each two members of V are joined by a simple path. Both tri-diagonal and quasi-diagonal matrices correspond to trees. (This is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.)

Let's start with an arbitrary vertex $r \in V$. If the set $T = \{v_i \in V \mid v_i \text{ is joined to } r\}$ is called a *rooted tree* with r added to be the root. Unlike a ordinary tree, T does not have to be a tree, which can best be explained by an example. A family tree. This is the set of all the vertices in $V \setminus \{r\}$ and these vertices are connected by a *shortest path* to r . If $v \in V \setminus \{r\}$ is joined to r by a simple path and we designate v as an *ancestor* of r and r as a *descendant* of v , except for r and v , as a *predecessor* of v and a *successor* of v . We say that a rooted tree T is *monotonically ordered* if each vertex is labelled with a unique integer $\ell(v)$ in other words we label the vertices from the top of the tree to the bottom. (We have already said it, relabelling a graph is the same as relabelling the rows and the columns of the underlying matrix.)

Every vertex then will be monotonically ordered and, in general, such an ordering is unique. We can give three consecutive orderings of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are renumbered so, that $T = (G, r)$ is monotonically ordered. Then, that $A = LL^T$ is a Cholesky factorization. It is true that

$$l_{k,j} = \frac{a_{k,j}}{l_{j,j}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

and their graphs

tridiagonal:
$$\begin{bmatrix} * & * & 0 & 0 & 0 \\ * & * & * & 0 & 0 \\ 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & * \end{bmatrix}$$

BASIS

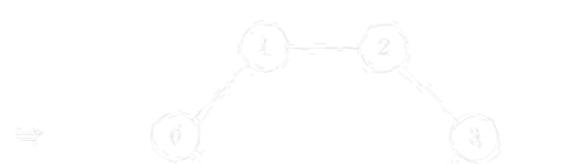

quindiagonal:

$$\begin{bmatrix} * & * & * & 0 & 0 & 0 \\ * & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

superdiagonal:

$$\begin{bmatrix} * & * & * & * & * & * \\ * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & * & 0 & 0 & 0 \\ 0 & 0 & 0 & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

cyclic:

$$\begin{bmatrix} * & 0 & 0 & 0 & * & * \\ * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & * & 0 & 0 & 0 \\ 0 & 0 & 0 & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

BUILDING BLOCKS

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

OF TESTS

At a first glance, this is not a matrix, but a graph of 10 nodes. It is, however, a matrix, just displayed, but its graph:

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{1, \dots, n\}$, $j_0 \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and superdiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $\alpha \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is unique. The following diagram shows three consecutive orderings of the same rooted tree.

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A were been arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just replace the weights as follows:

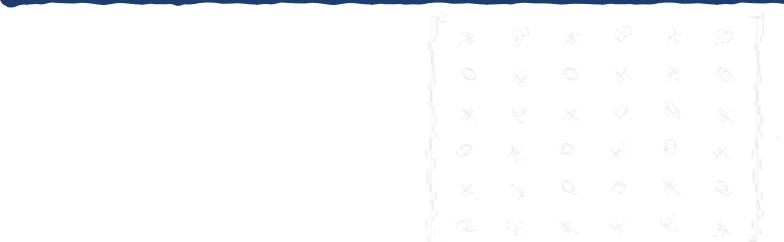

Create Edit Delete Clone Import

[[*, 0, 0, 0, 0, 0], [0, *, 0, 0, 0, 0], [0, 0, *, 0, 0, 0], [0, 0, 0, *, 0, 0], [0, 0, 0, 0, *, 0], [0, 0, 0, 0, 0, *]]

A single sparse matrix. Both tridiagonal and any banded matrices correspond to trees, but this is not the case with either anti-diagonal or cyclic matrices when $n > 3$.

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just read the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 5, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, j)\}_{i,j}$, $\mathcal{S} \subseteq \mathbb{S}$ is called a path joining the vertices v_i and v_j ($i, j \in \{1, 2, \dots, n\}$, $\mathcal{S} \subseteq \{1, 2, \dots, n\} \times \{1, 2, \dots, n\}$) and for any $k = 1, 2, \dots, n-1$ the set $\{(v_i, j)\} \cap \{(v_i, j+k)\}$ contains exactly one edge. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if none of members of \mathbb{V} are joined by a single simple path. But tridiagonal and quadiagonal matrices contain cycles.

Let this is not the case with either quadiagonal or cyclic matrices. If we create a tree T and a arbitrary vertex $r \in \mathbb{V}$, the pair $T \sim (r, \mathcal{S})$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T has its natural partial order, which can best be explained by an analogy with a family tree. The root r is the predecessor of all the vertices in $T \sim (r, \mathcal{S})$ and these vertices are successors of r . Moreover, r is the root of T if and only if there is no other vertex along this path, except r and v_i , as a predecessor of v_i and a successor

We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors in other words we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to relabelling the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We will give three consecutive drawings of the same rooted tree.

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just read the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 4, 5 \rightarrow 6, 6 \rightarrow 8.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0), \dots, (i_{v-1}, j_{v-1})\}$ is called a path joining the vertices i_0 and i_{v-1} ($i_0, i_1, \dots, i_{v-1}, i_v \in V$, $j_0, j_1, \dots, j_{v-1} \in V$), and for any $k = 1, 2, \dots, v-1$ the set $\{(i_k, j_k) \mid (i_k, j_{k+1}) \in \{(i_0, j_0), \dots, (i_{v-1}, j_{v-1})\}\}$ contains exactly one edge. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if no two members of V are joined by a single simple path. Both tridiagonal and quadiagonal matrices correspond to trees, but this is not the case with either quadiagonal or cyclic matrices when $n \geq 3$.

Create a tree T and a arbitrary vertex $r \in V$, the pair $T \sim (r, T)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T has a natural partial order, which can best be explained by an analogy with a family tree. Thus, the vertex r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate vertex along this path, except r and a , as a predecessor of a and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to relabelling the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We will give three consecutive drawings of the same rooted tree.

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are now arranged so, that $T = (r, T)$ is monotonically ordered. Then, that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{k,j}}{l_{j,j}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

triangular:

$$\begin{bmatrix} * & * & * & * & * & * \\ * & * & 0 & 0 & 0 & 0 \\ * & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

cyclic:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & * \\ * & * & 0 & 0 & 0 & 0 \\ 0 & 0 & * & 0 & 0 & 0 \\ 0 & 0 & 0 & * & 0 & 0 \\ 0 & 0 & 0 & 0 & * & 0 \\ 0 & 0 & 0 & 0 & 0 & * \end{bmatrix}$$

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}$$

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

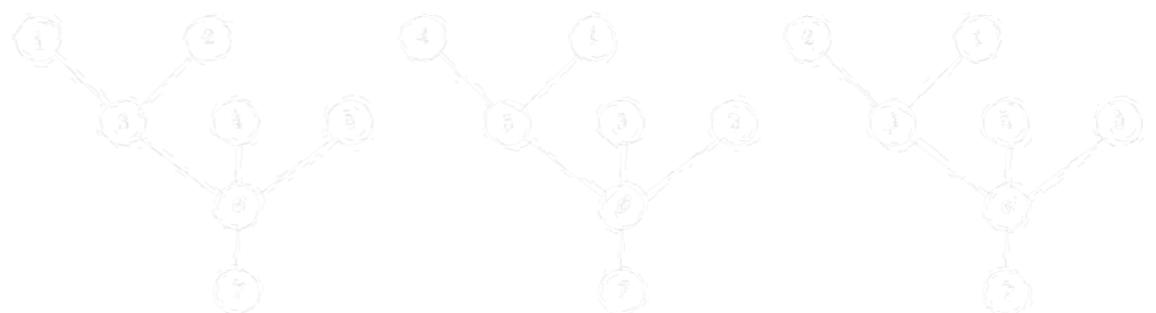

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tri-diagonal and any other matrices A are not trees, but this is not the case with either quidiagonal or cyclic matrices.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial order, which can best be explained by an analogy with a family tree. The vertex r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors. Moreover, every $\alpha \in V \setminus \{r\}$ has a unique predecessor α' and an immediate vertex along this path, except for r and α , as a predecessor of α and a successor.

We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree.

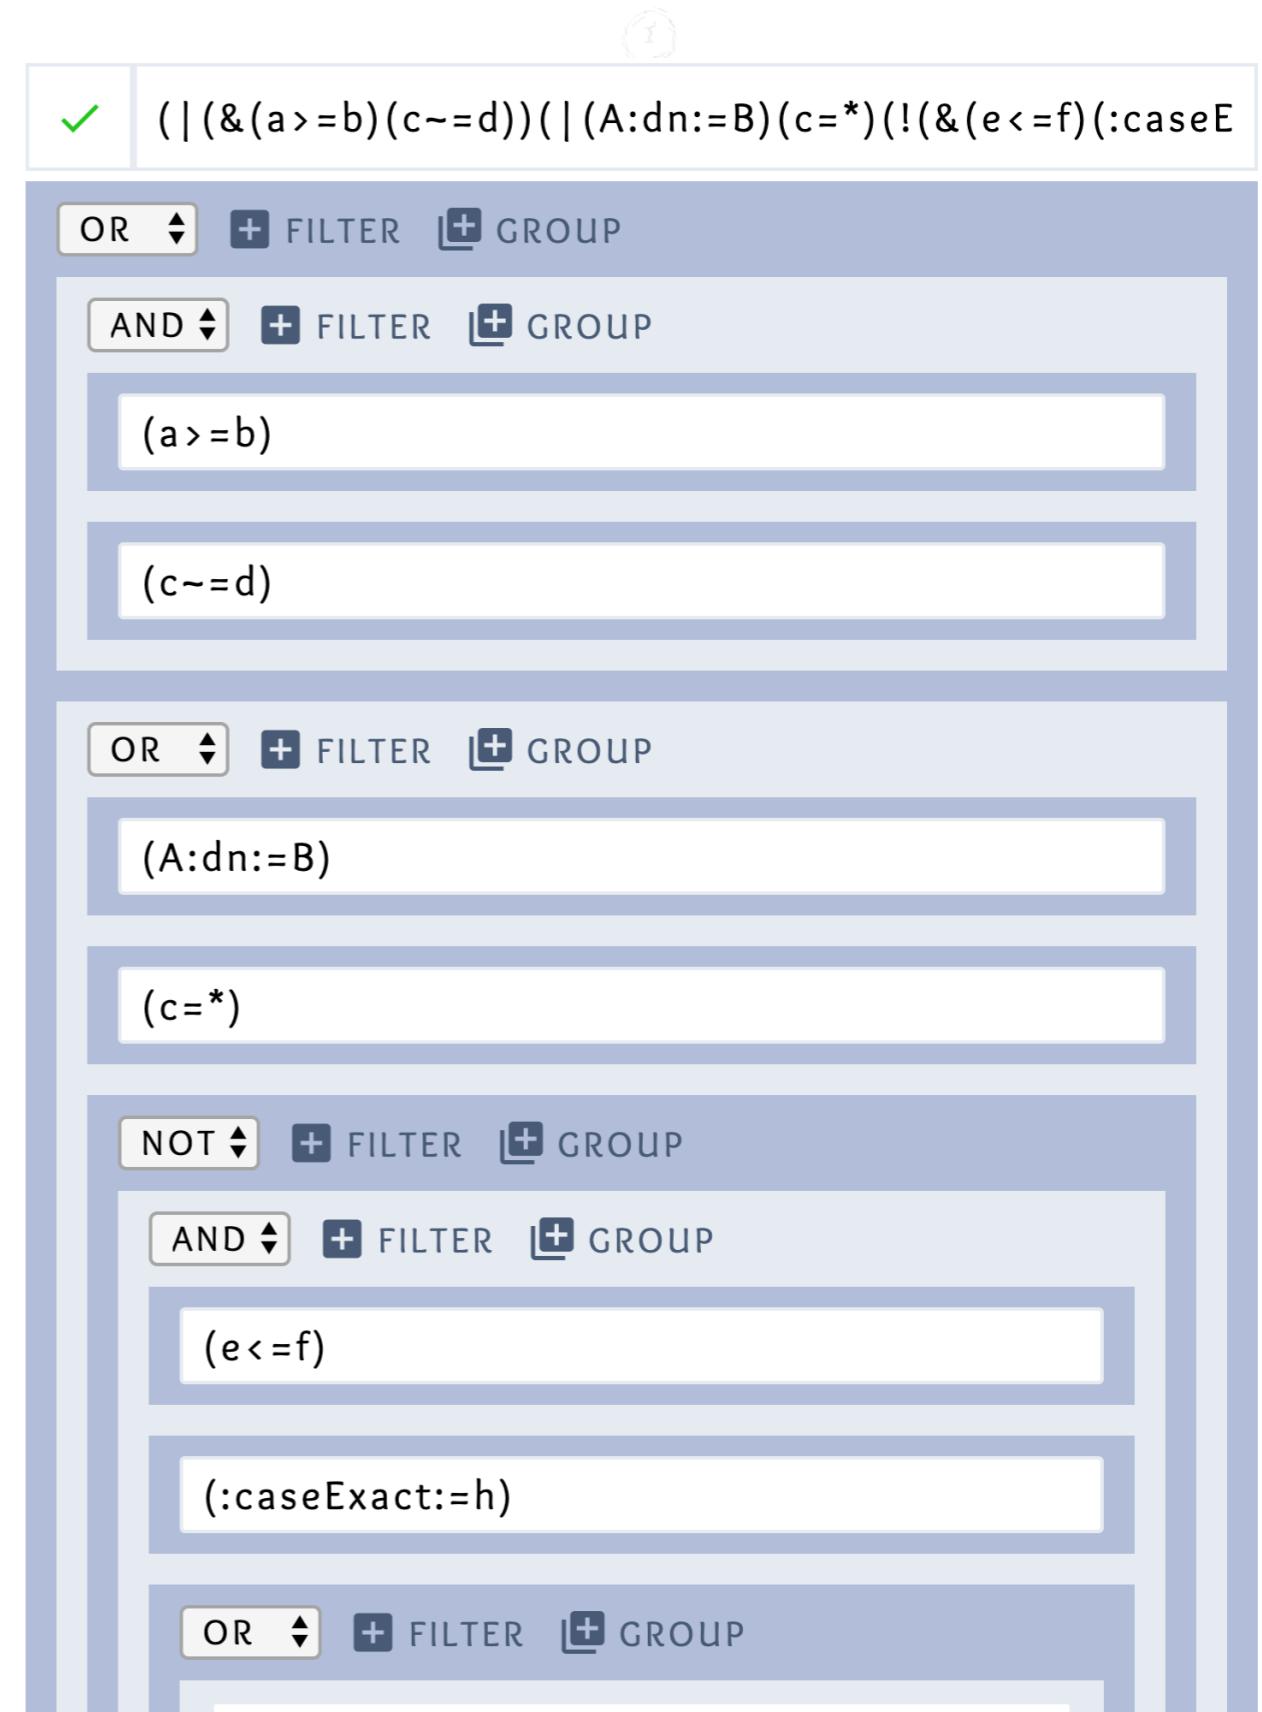

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{\sum_{i=1}^j a_{ki}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their ranks.

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

At a first glance, there is nothing to think in the case of the four matrices that we have just displayed, but its graph.

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, j_i)\}_{i=1}^n$ in \mathbb{G} is called a path joining the vertices v_i and v_{i+1} ($i = 1, 2, \dots, n-1$), $j_i \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{v_i, j_i\} \cap \{v_{i+k}, j_{i+k}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members of \mathbb{V} are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $p \geq 3$.

Given a tree \mathbb{G} and an arbitrary vertex $r \in \mathbb{V}$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $\mathbb{V} \setminus \{r\}$ and these vertices are successors of r . Moreover, every $v \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and v , as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, we label the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree.

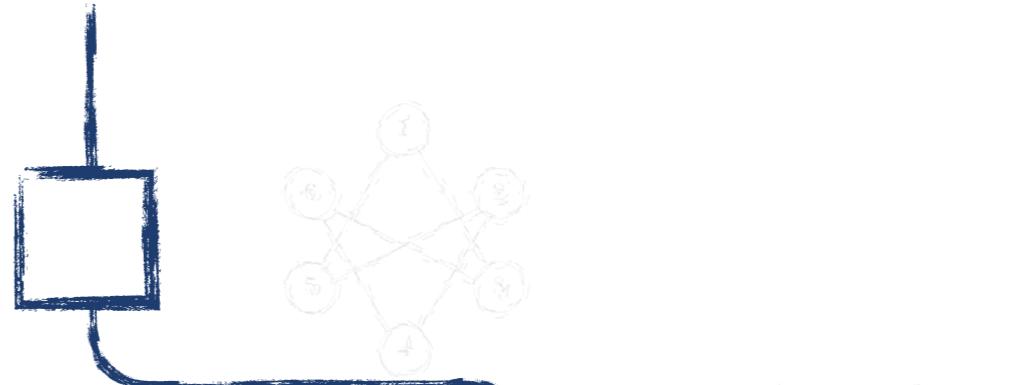

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

```

    x = x + 1;
  } else {
    console.log('error');
  }
  return x;
}
```

just displayed, but its graph:

tells a different story – \mathbf{g} is not a tree. In a cyclic matrix in discussed. To see this, just re-label the vertices as follows:

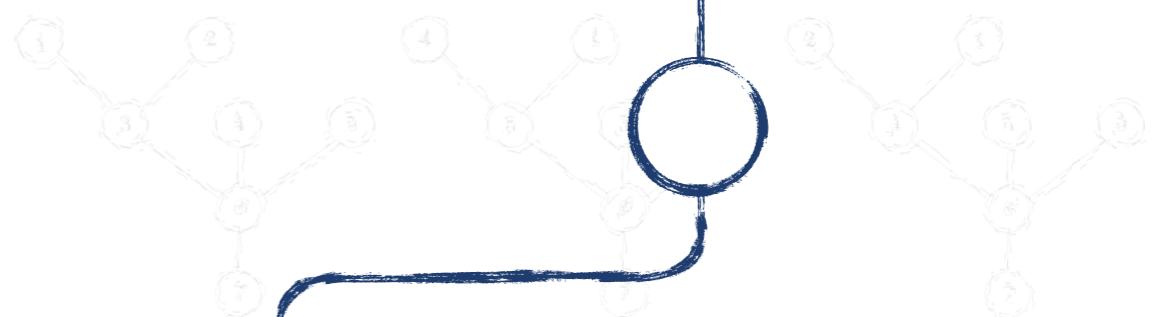

$$1 \rightarrow 1, \quad 2 \rightarrow 3, \quad 3 \rightarrow 2, \quad 4 \rightarrow 5, \quad 5 \rightarrow 6, \quad 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (swapping) the equations and variables.

An ordered set of edges $\{(i_1, j_1)\}_{i_1, j_1 \in \{1, \dots, n\}}$ is a path joining the vertices i_1 and j_1 if $i_1 \in \{1, \dots, n\}$, $j_1 \in \{1, \dots, n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_{k+1}, j_{k+1}\} \cap \{i_k, j_k\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbf{G} is a tree if each two members of \mathbf{V} are joined by a unique simple path. Both tridiagonal and banded matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n > 3$.

Given a tree \mathbf{G} and an arbitrary vertex $r \in \mathbf{V}$, the path $T = (Q, \pi)$ is called a rooted tree, while r is said to be the root. Unlike in an ordinary tree, the root r is not necessarily unique, which can best be explained by an analogy with a family tree. The root r is the predecessor of all the vertices in $\mathbf{V} \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in \mathbf{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a predecessor of a and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors; in other words, a vertex a is to the right of r if it is further from the root to the left. (As we have already said, we are permuting the rows and the columns of the matrix, so the order of the columns in the matrix is not unique.)

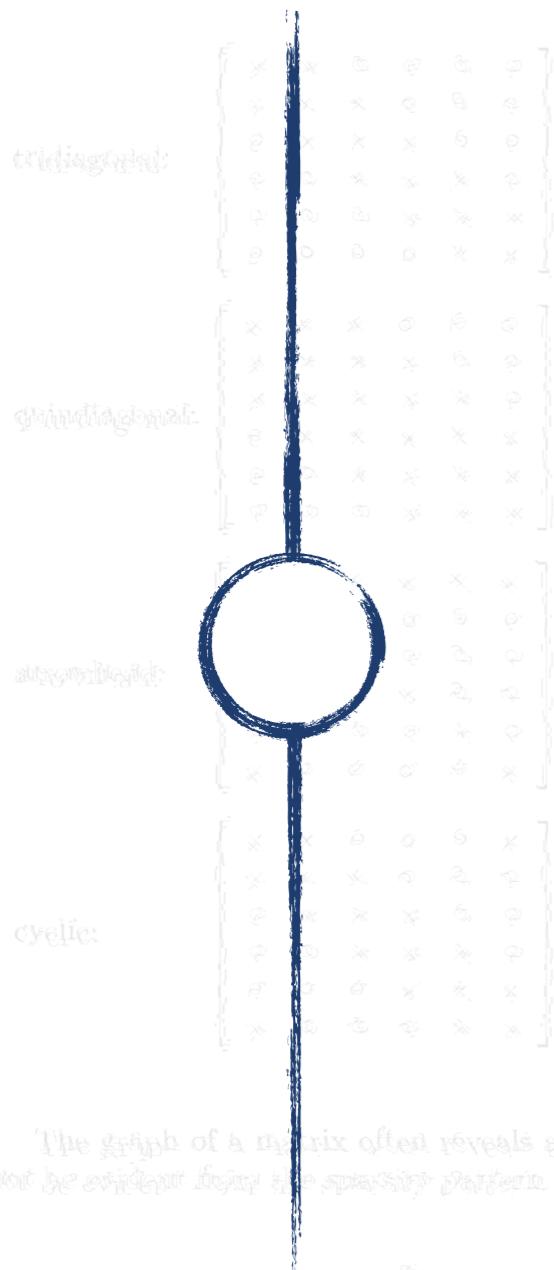

Every rooted tree will be monotonically ordered, but in general such an ordering is not unique. We now give three consecutive stages of the same rooted tree:

Theorem 2.1 Let \mathbf{A} be a symmetric matrix whose graph \mathbf{G} is a tree. Choose a root $r \in \{1, 2, \dots, n\}$. Assume that the rows and columns of \mathbf{A} have been arranged so that $T = (Q, \pi)$ is monotonically ordered. Then the Cholesky factorization of \mathbf{A} is

$$L_{k,j} = \frac{a_{k,j}}{a_{kk}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (1.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

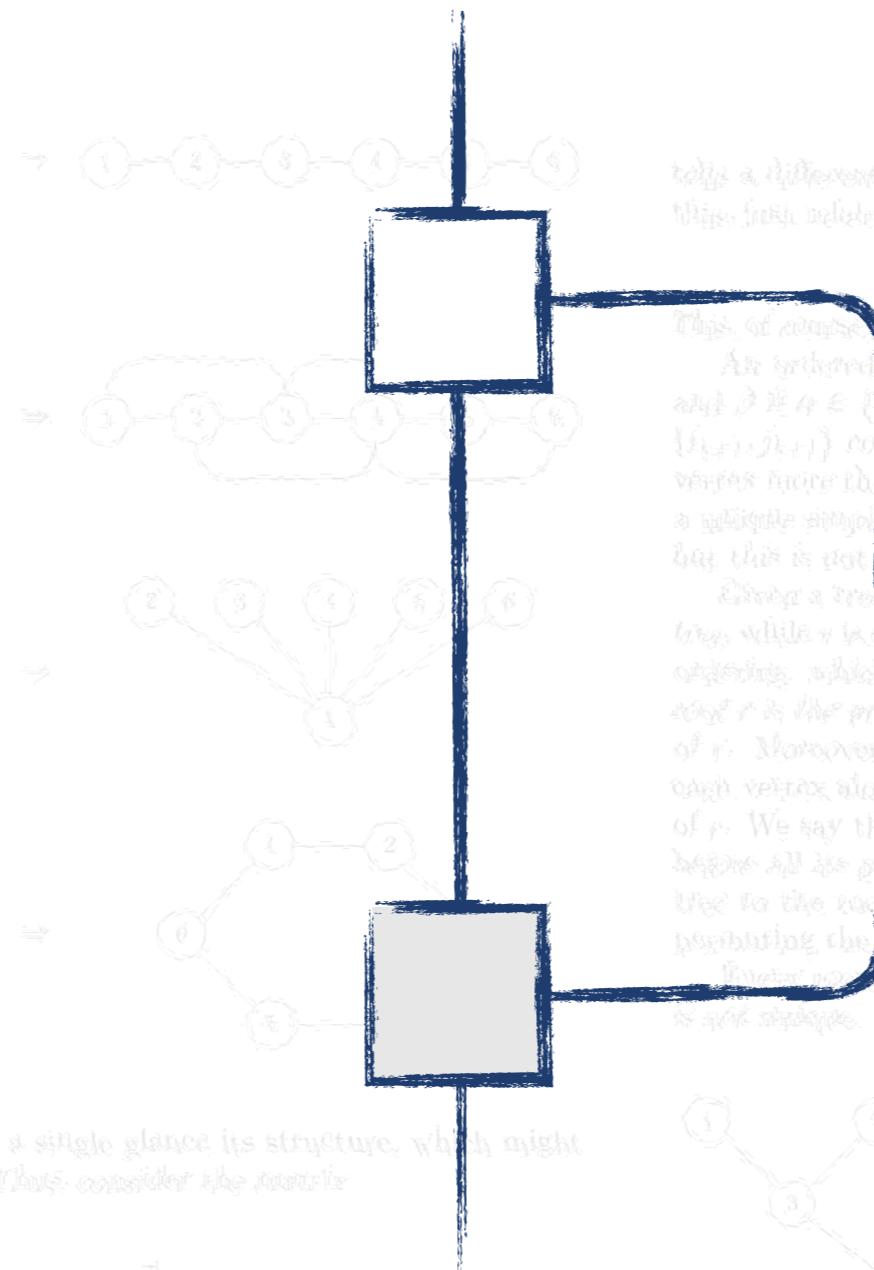

The graph of a matrix often reveals at a single glance its structure, which might not be evident from its sparsity pattern. Thus, consider the matrix

$$\text{LOG} \quad \begin{bmatrix} * & 0 & * & 0 & * & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ * & 0 & * & 0 & * & 0 \end{bmatrix}$$

| F

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first recall that the vertices are

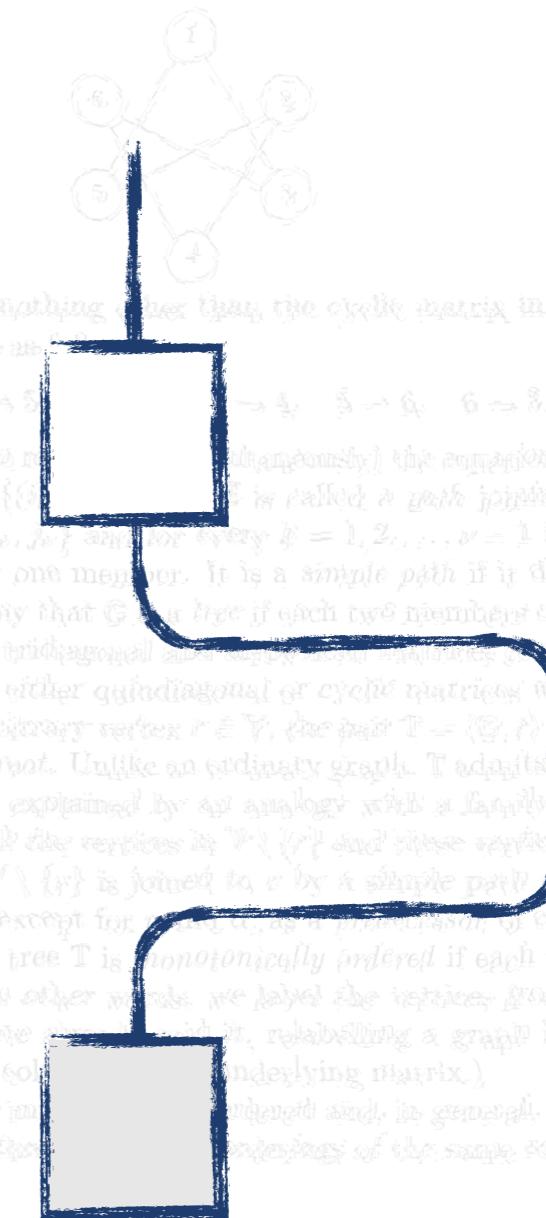

$$1 \rightarrow 1, \quad 2 \rightarrow 2, \quad \dots, \quad 5 \rightarrow 6, \quad 6 \rightarrow 1.$$

This, of course, is equivalent to renumbering (simultaneously) the equations and variables.

An ordered set of edges $\{(v_i, w_i)\}_{i=1}^n$ in $G = (V, E)$ is called a path joining the vertices v_1 and v_n if $i \in \{1, \dots, n\}$, $v_i \in V$, $w_i \in V$, and for every $k = 1, 2, \dots, n-1$ the set $\{v_k, w_k\} \cap \{v_{k+1}, w_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and pentadiagonal matrices correspond to trees, but this is not the case with either quadiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $v \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r itself, as a predecessor of v and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors in other words, we layed the vertices from the top of the tree to the root. (As we have mentioned it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Even a binary tree will be monotonically ordered and, in general, such an ordering is not unique. We will give the

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Then, that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{a_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_1, j_1), (i_2, j_2), \dots, (i_v, j_v)\}$ in \mathbb{G} is called a *path* joining the vertices i_1, i_2, \dots, i_v (j_1, j_2, \dots, j_v) and, for every $k = 1, 2, \dots, v-1$ the set $\{(i_k, j_k), (i_{k+1}, j_{k+1})\}$ contains exactly one edge. It is a *simple path* if it does not visit any vertex more than once. We say that \mathbb{G} is a *tree* if each two members of \mathbb{V} are joined by a single simple path. Back to graphs, the quadiagonal matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $p \geq 3$.

Given a tree \mathbb{G} and an arbitrary vertex $r \in \mathbb{V}$, the pair $T = (G, r)$ is called a *rooted tree*, while r is said to be the *root*. Unlike in ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the *predecessor* of all the vertices in $\mathbb{V} \setminus \{r\}$ and these vertices are *successors* of r . Moreover, every $\alpha \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and α , as a *predecessor* of α and a *successor* of r . We say that the rooted tree T is *monotonically ordered* if each vertex is labelled before all its predecessors; in other words, we *layer* the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is unique. We now give three consecutive endings of the same rooted tree:

Theorem 1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

```

tells a different story - it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 2, 3 \rightarrow 3, 4 \rightarrow 4, 5 \rightarrow 5, 6 \rightarrow 6.$$

Of course, it is equivalent to renumbering the equations and variables. As you can see from the figure, G is called a tree, since the vertices v and α ($v \in V \setminus \{\alpha\}$, $\beta \in V \setminus \{\alpha\}$) and for every $k = 1, 2, \dots, n-1$ the set $\{v_1, v_2, \dots, v_k\} \cap \{v_{k+1}, v_{k+2}, \dots, v_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either of banded or cyclic matrices when $p \geq 3$.

Of course, it is equivalent to renumbering the equations and variables. As you can see from the figure, G is called a tree, since the vertices v and α ($v \in V \setminus \{\alpha\}$, $\beta \in V \setminus \{\alpha\}$) and for every $k = 1, 2, \dots, n-1$ the set $\{v_1, v_2, \dots, v_k\} \cap \{v_{k+1}, v_{k+2}, \dots, v_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either of banded or cyclic matrices when $p \geq 3$.

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

At a first glance, this is not a very useful formula, but it is the basis for the following algorithm.

just displayed, but its graph:

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & 0 & * & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & 0 & * & * \end{bmatrix}.$$

At a first glance, there is nothing to think in the case of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_k, j_k)\}_{k=1}^n$ in \mathbb{G} is called a path joining the vertices i and j if $i \in \{i_1, j_1\}$, $j \in \{i_n, j_n\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that \mathbb{G} is a tree if each two members of \mathbb{V} are joined by a unique simple path. Both tridiagonal and any other matrices correspond to trees, but this is not the case with either quidiagonal or cyclic matrices when $n \geq 3$.

Given a tree \mathbb{T} and an arbitrary vertex $r \in \mathbb{V}$, the pair $\mathbb{T} = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in ordinary graph, \mathbb{T} admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the predecessor of all the vertices in $\mathbb{V} \setminus \{r\}$ and these vertices are successors of r . More generally, if α is a vertex in \mathbb{V} , then we designate each vertex along this path, except for r and α , as a predecessor of α and a successor of r . We say that the rooted tree \mathbb{T} is monotonically ordered if each vertex is labelled before all its successors. In other words, we layed the tree down the top at the tree's root. (As we have seen, it is said it, relabelling \mathbb{V} is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree:

Theorem 11.1. Let A be a symmetric matrix whose graph \mathbb{G} is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so that $\mathbb{T} = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{l_{j,j}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity)

YOU CAN FIND EQUALLY MANY NUMBERS BETWEEN 0 AND 1 AS YOU CAN

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

BETWEEN $-\infty$ AND ∞ .

At a first glance this is not a matrix, but it is a little known triangular matrix, just displayed, but its graph,

It is a different story – it is nothing other than the cyclic matrix in disguised. To see this, let us relabel the vertices as follows:

$$1 \rightarrow 1, 2 \rightarrow 5, 3 \rightarrow 2, 4 \rightarrow 3, 5 \rightarrow 6, 6 \rightarrow 1.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(u_i, v_i)\}_{i=1}^r$ in \mathbb{G} is called a path joining the vertices u_1 and u_r if $u_i \in \{u_1, u_2\}$, $v_i \in \{v_1, v_2\}$ and for every $i = 1, 2, \dots, r-1$ the set $\{u_i, v_i\} \cap \{u_{i+1}, v_{i+1}\} = \emptyset$. A path is called simple if it does not visit any vertex more than once. We say that a path is closed if all its vertices are joined by a single simple path. Below we present two examples. Matrices corresponding to these, but this is not the case with either quidiagonal or cyclic matrices when $p \geq 3$.

Given a tree \mathbb{G} and an arbitrary vertex $r \in \mathbb{V}$, the pair $T = (G, r)$ is called a rooted tree, while r is said to be the root. Unlike in a ordinary graph, T admits a natural partial ordering, which can best be explained by an analogy with a family tree. Thus, the root r is the ancestor of the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in \mathbb{V} \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a predecessor of a and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors. In other words, we label the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three concrete examples of the same rooted tree.

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tridiagonal:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \rightarrow \text{Graph: } 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$$

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first, re-label the weights as follows:

$$w_{12} = w_{23} = w_{34} = w_{45} = w_{56} = w_{61} = 1, \quad w_{13} = w_{24} = w_{35} = w_{46} = 2, \quad w_{14} = w_{25} = w_{36} = 3$$

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & * & 0 \\ * & 0 & * & 0 & 0 & * \\ 0 & * & 0 & * & 0 & * \\ * & 0 & 0 & 0 & * & 0 \\ 0 & * & * & * & * & * \end{bmatrix}.$$

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $\mathbb{T} = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{\sum_{i \sim j} a_{ki}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

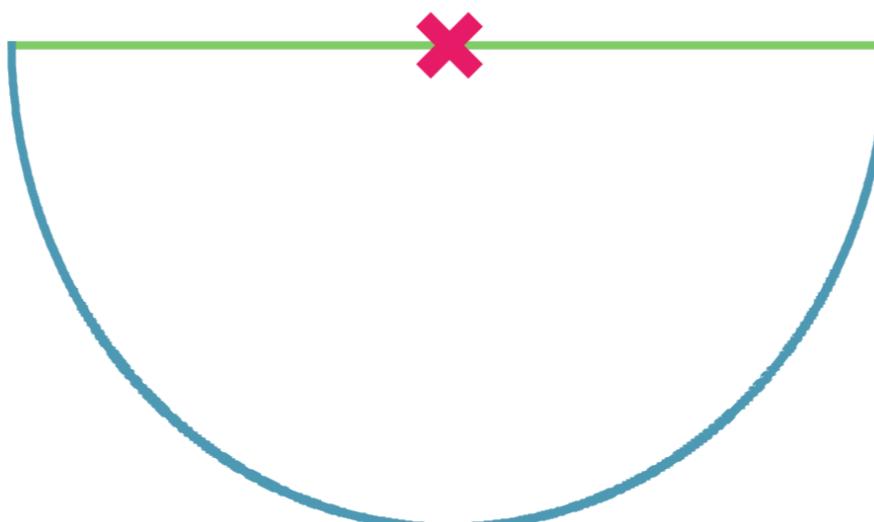

At a first glance, there is nothing to think in the case of the first matrices that we have just displayed, but its graph.

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tridiagonal:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \rightarrow \text{Graph: } 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$$

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first, re-label the vertices as follows:

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & * & 0 \\ * & 0 & * & 0 & 0 & * \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & 0 & * \\ 0 & * & * & * & * & * \end{bmatrix}$$

At a first glance, there is nothing to think in the case of the first matrices that we have just displayed, but its graph:

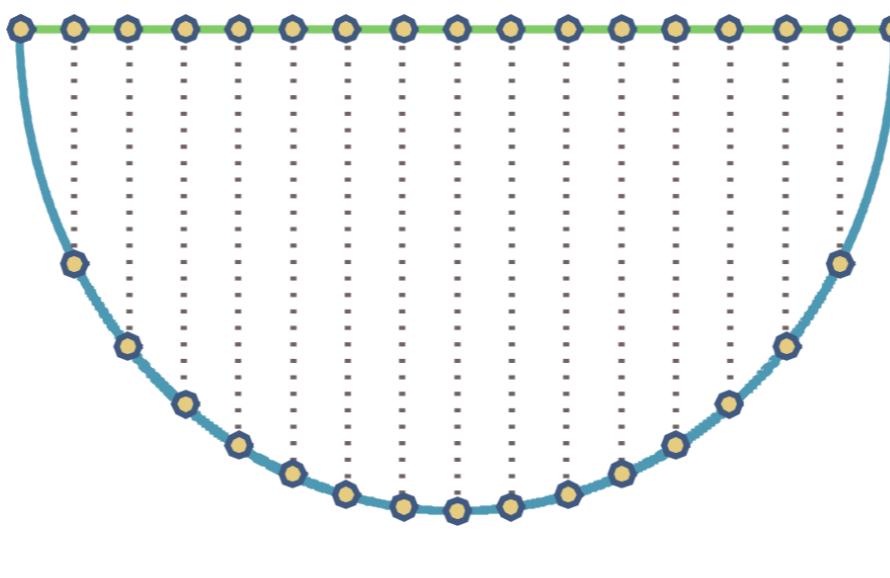

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $\mathbb{T} = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{\sum_{i=1}^j a_{ii}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just re-label the weights as follows:

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are then arranged so, that $T = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

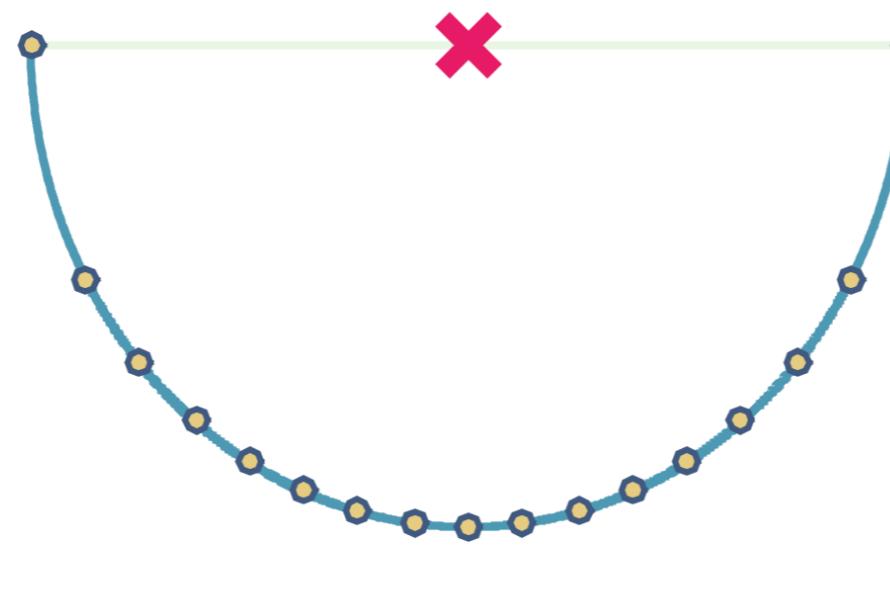

$$l_{k,j} = \frac{a_{kj}}{l_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tridiagonal:

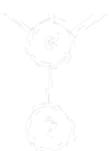

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \rightarrow \text{Graph: } 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$$

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, first recall the weights as follows:

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & * & 0 \\ * & 0 & * & 0 & 0 & * \\ 0 & * & 0 & * & 0 & * \\ * & * & 0 & 0 & * & 0 \\ 0 & * & * & * & * & * \end{bmatrix}.$$

At a first glance, there is nothing to think in the case of the four matrices that we have just displayed, but its graph.

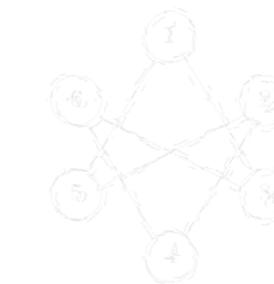

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $\mathbb{T} = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{\sum_{i=1}^j a_{ii}}, \quad k = j+1, j+2, \dots, d, \quad j = 1, 2, \dots, d-1. \quad (11.5)$$

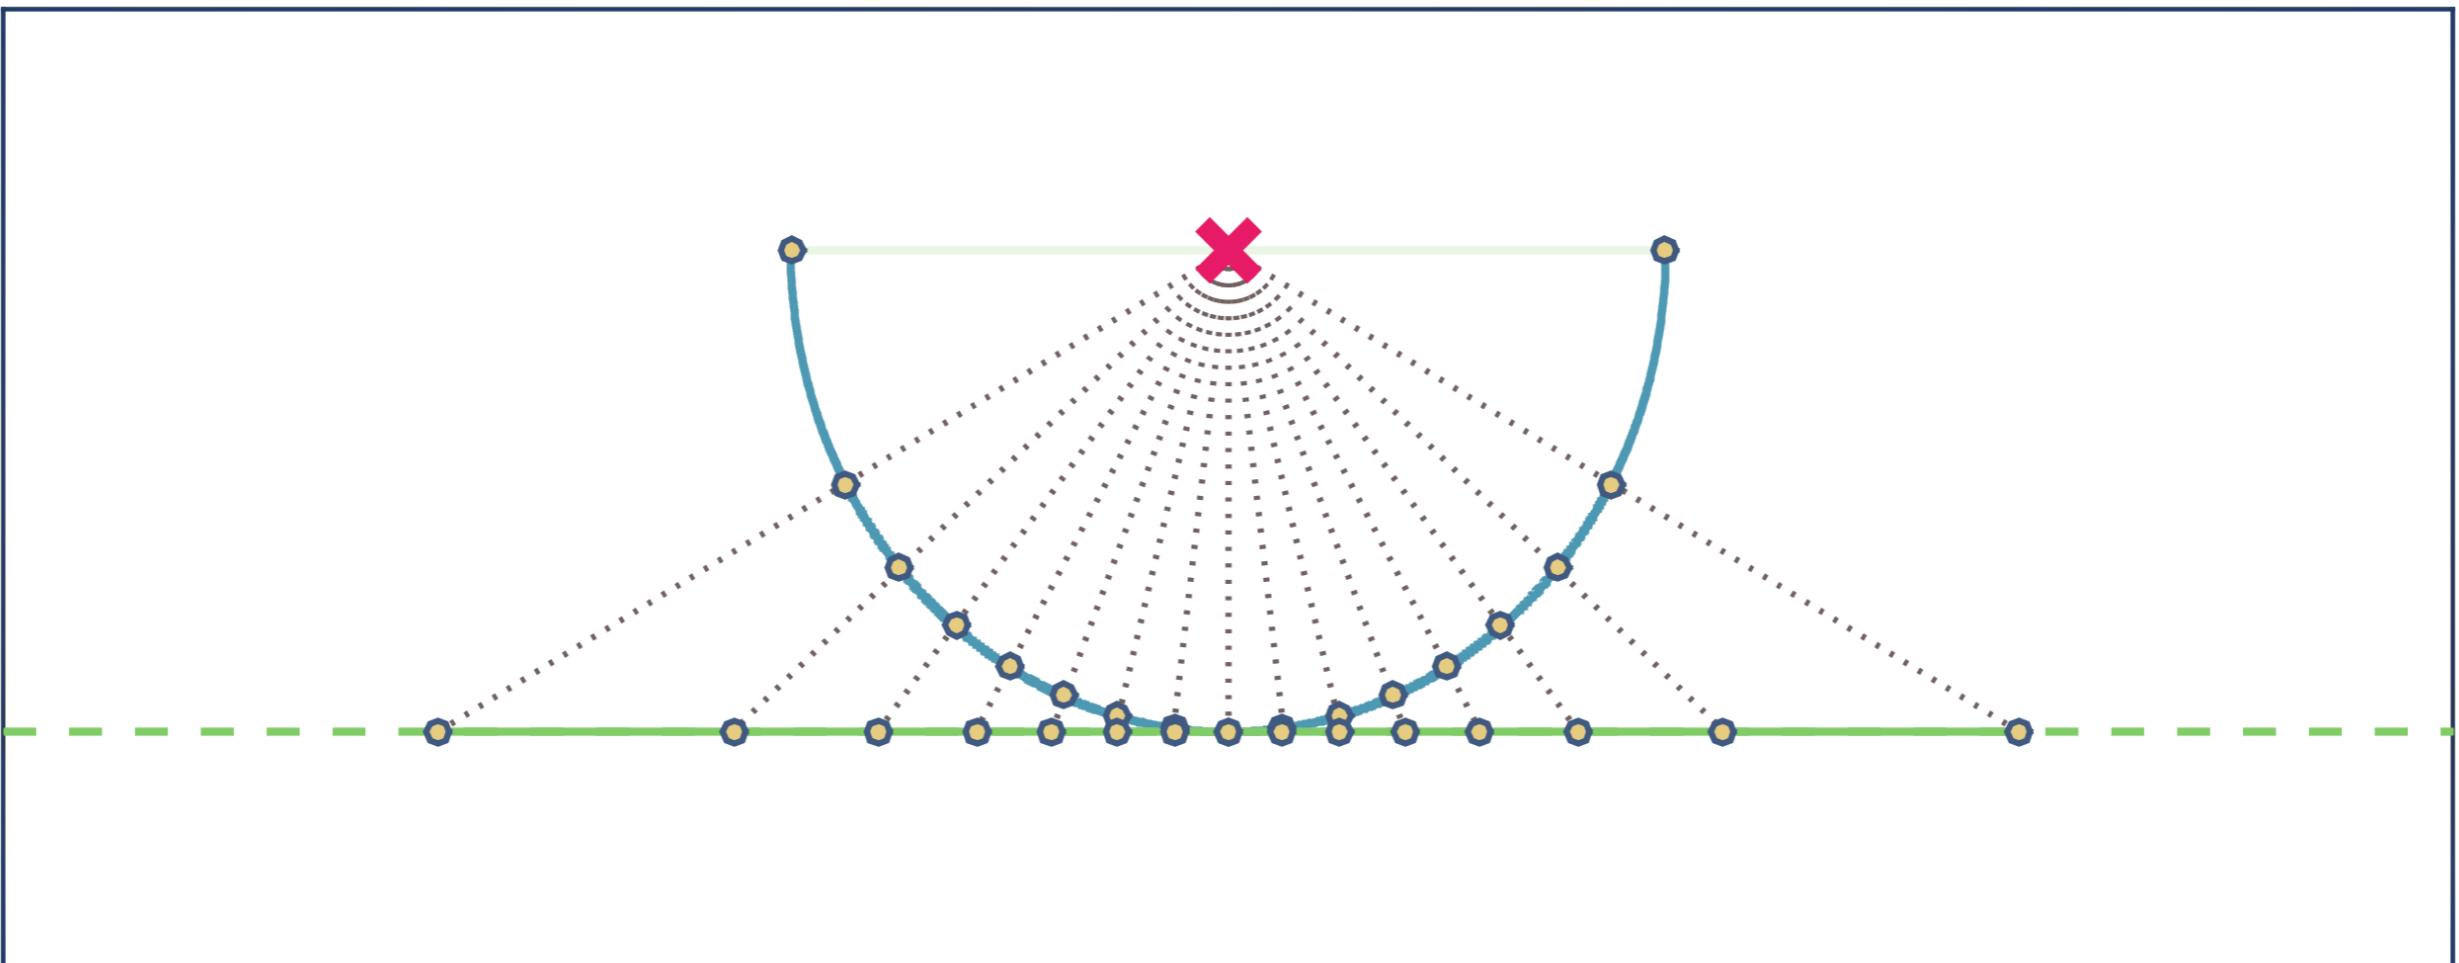

Therefore we will now give a few examples of matrices (represented by their sparsity pattern) and their graphs.

tridiagonal:

$$\begin{bmatrix} * & * & 0 & 0 & 0 & 0 \\ * & * & * & 0 & 0 & 0 \\ 0 & * & * & * & 0 & 0 \\ 0 & 0 & * & * & * & 0 \\ 0 & 0 & 0 & * & * & * \\ 0 & 0 & 0 & 0 & * & * \end{bmatrix} \rightarrow \text{Graph: } 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6$$

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just re-label the vertices as follows:

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}.$$

At a first glance, there is nothing to think in the case of the four matrices that we have just displayed, but its graph:

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Choose a root $r \in \{1, 2, \dots, d\}$ and assume that the rows and columns of A are then arranged so, that $\mathbb{T} = (G, r)$ is monotonically ordered. Given that $A = LL^T$ is a Cholesky factorization, it is true that

The graph of a matrix often reveals at a single glance its structure, which might not be evident from the sparsity pattern. Thus, consider the matrix

$$\begin{bmatrix} * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & 0 \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \\ * & 0 & * & 0 & * & 0 \\ 0 & * & 0 & * & 0 & * \end{bmatrix}.$$

At a first glance, there is nothing to link it to any of the four matrices that we have just displayed, but its graph,

tells a different story – it is nothing other than the cyclic matrix in disguised. To see this, just relabel the vertices as follows:

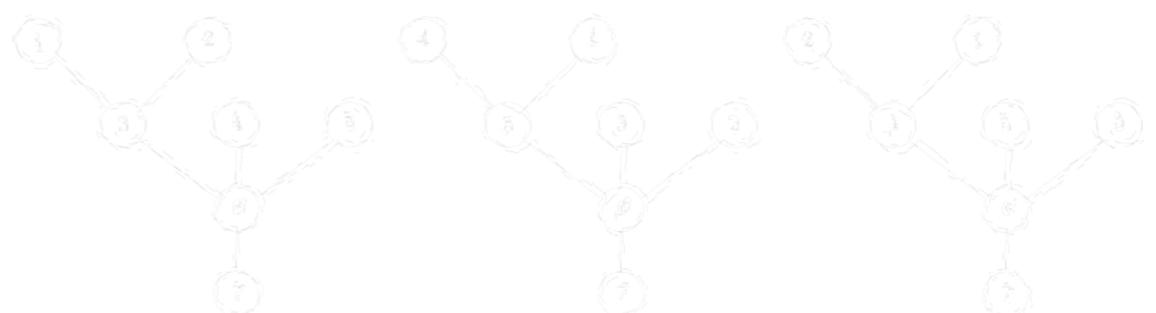

$$1 \rightarrow 1, \quad 2 \rightarrow 5, \quad 3 \rightarrow 2, \quad 4 \rightarrow 3, \quad 5 \rightarrow 6, \quad 6 \rightarrow 4.$$

This, of course, is equivalent to reordering (simultaneously) the equations and variables.

An ordered set of edges $\{(i_0, j_0)\}_{i_0, j_0 \in \{1, \dots, n\}}$ is called a path joining the vertices i_0 and j_0 if $i_0 \in \{i_0, j_0\}$, $j_0 \in \{i_0, j_0\}$ and for every $k = 1, 2, \dots, n-1$ the set $\{i_k, j_k\} \cap \{i_{k+1}, j_{k+1}\}$ contains exactly one member. It is a simple path if it does not visit any vertex more than once. We say that G is a tree if each two members of V are joined by a unique simple path. Both tridiagonal and qundiagonal matrices correspond to trees, but this is not the case with either qundiagonal or cyclic matrices when $n \geq 3$.

Given a tree T and an arbitrary vertex $r \in V$, the pair $T = (G, r)$ is called a rooted tree, where the vertex r is the root. Unlike in ordinary graph, T admits a natural partial order which should be explained by an analogy with a family tree. Thus, the vertex r is the predecessor of all the vertices in $T \setminus \{r\}$ and these vertices are successors of r . Moreover, every $a \in V \setminus \{r\}$ is joined to r by a simple path and we designate each vertex along this path, except for r and a , as a predecessor of a and a successor of r . We say that the rooted tree T is monotonically ordered if each vertex is labelled before all its predecessors in other words, we layed the vertices from the top of the tree to the root. (As we have already said it, relabelling a graph is tantamount to permuting the rows and the columns of the underlying matrix.)

Every rooted tree will be monotonically ordered and, in general, such an ordering is not unique. We now give three consecutive orderings of the same rooted tree.

Theorem 11.1. Let A be a symmetric matrix whose graph G is a tree. Consider a root $r \in \{1, 2, \dots, n\}$ and assume that the rows and columns of A are now arranged so that $T = (G, r)$ is monotonically ordered. Given that $A = PLU$ is a Cholesky factorization, it is true that

$$l_{k,j} = \frac{a_{kj}}{p_{jj}}, \quad k = j+1, j+2, \dots, n, \quad j = 1, 2, \dots, n-1. \quad (11.5)$$
